DM Multimedia has a well-deserved reputation for developing unique and highly effective web/computer-based training (W/CBT) and excellent instructional design.

Web/Computer-Based Training

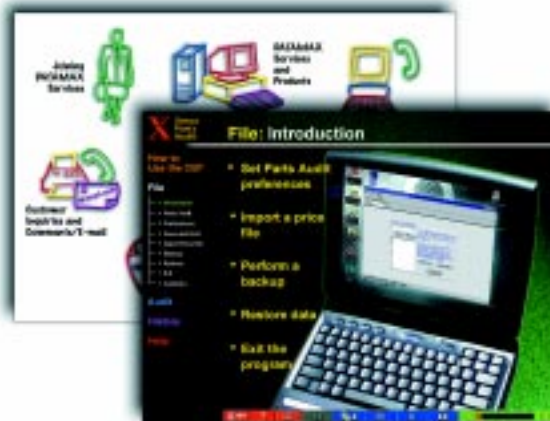

W/CBT is an outstanding tool for acquiring knowledge and developing new skills. With traditional classroom training (such as in an instructor-led classroom), the pace of learning is set by the slowest learner in the class. However, with W/CBT all learners can advance through the material at their own pace.

Well-designed W/CBT includes:

- visuals (videos, captions and images),
- audio, and
- action (interactive)

It allows the learners to skip over material already known or mastered or repeat levels until mastery is achieved.

Graphical User Interface Design

DM Multimedia's trademark is intuitive and very-user friendly design. Our graphical user interface design matches the skill levels of all users, from novice to experienced. We pride ourselves on our ability to translate complicated information and details into visually exciting and clear navigation. Simple designs for presenting detailed information are what we strongly advocate.

Instructional Design

To assure the success of W/CBT and presentation projects, DM Multimedia believes in involving instructional design in project development. Good instructional design provides a strong framework for organizing concepts, sound, video, testing, and correction in developing effective W/CBT programs and presentations.

DM Multimedia can provide training through a CD, a local server (Intranet), or the Internet.
